.

## **Merge Sort**

Write a Python program to sort a list of elements using the merge sort algorithm.

### For example:

Input	Result
5 6 5 4 3 8	3 4 5 6 8

# Program:

```
a=int(input())
l=[]
l.extend(input().split())
for i in range(a-1):
    for j in range(a-1):
        if(int(|[j])>int(|[j+1])
        ):
        t=int(|[j])
        |[j]=int(|[j+1])
        |[j+1]=t
for i in range(a):
    print(int(|[i]),end="
        ")
```

	Input	Expected	Got
~	5 6 5 4 3 8	3 4 5 6 8	3 4 5 6 8
~	9 14 46 43 27 57 41 45 21 70	14 21 27 41 43 45 46 57 70	14 21 27 41 43 45 46 5
~	4 86 43 23 49	23 43 49 86	23 43 49 86

### **Bubble Sort**

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the first element in the sorted list.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps. First Element: 1 Last Element: 6

#### **Input Format**

The first line contains an integer, n, the size of the <u>list</u> a . The second line contains n, space-separated integers a[i].

#### **Constraints**

- · 2<=n<=600
- $\cdot$  1<=a[i]<=2x10<sup>6</sup>.

#### **Output Format**

You must print the following three lines of output:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted list.

#### Sample Input 0

3

123

#### **Sample Output 0**

List is sorted in 0

swaps. First Element:

1

Last Element: 3

### For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 1928 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9

# Program:

```
def
  bubble_sort(arr)
  : n = len(arr)
  swaps = 0
  for i in range(n):
     for j in range(0, n-i-
       1): if arr[j] > arr[j]
            + 1]: # Swap
                elements
         arr[j], arr[j + 1] = arr[j + 1], arr[j]
         swaps += 1
  return swaps
# Input the size of the
list n = int(input())
# Input the list of integers
arr = list(map(int, input().split()))
# Perform bubble sort and count the number of swaps
num_swaps = bubble_sort(arr)
```

```
# Print the number of swaps
print("List is sorted in", num_swaps, "swaps.")

# Print the first element
print("First Element:",
arr[0])

# Print the last element
print("Last Element:", arr[-
1])
```

	Input	Expected	Got	
<b>~</b>	3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3	List is sorted in 3 swaps. First Element: 1 Last Element: 3	~
<b>~</b>	5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9	List is sorted in 4 swaps. First Element: 1 Last Element: 9	~

.

#### **Peak Element**

Given an <u>list</u>, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

 $A[i-1] \le A[i] > =a[i+1]$  for middle elements.

[0<i<n-1] A[i-1] <= A[i] for last element [i=n-1]

A[i] > = A[i+1] for first element [i=0]

#### **Input Format**

The first line contains a single integer n , the length of A . The second line contains n space-separated integers,A[i].

#### **Output Format**

**Print** peak numbers separated by space.

#### **Sample Input**

5

8 9 10 2 6

### **Sample Output**

106

### For example:

Input	Result
4 12 3 6 8	12 8

## Program:

def find\_peak(arr):

peak\_elements = []

```
# Check for the first
  element if arr[0] >=
  arr[1]:
    peak_elements.append(arr[0])
  # Check for middle
  elements for i in range(1,
  len(arr) - 1):
    if arr[i - 1] \le arr[i] >= arr[i + 1]:
      peak_elements.append(arr[i])
  # Check for the last
  element if arr[-1] >= arr[-
  2]:
    peak_elements.append(arr[-1])
 return peak_elements
# Input the length of the
list n = int(input())
   # Input the list of
        integers
arr = list(map(int, input().split()))
# Find peak elements and print the result
peak_elements = find_peak(arr)
print(*peak_elements)
```

	Input	Expected	Got	
~	7 15 7 10 8 9 4 6	15 10 9 6	15 10 9 6	<b>~</b>
~	4 12 3 6 8	12 8	12 8	<b>~</b>

.

## **Binary Search**

Write a Python program for binary search.

### For example:

Input	Result	
12358	False	
3 5 9 45 42 42	True	

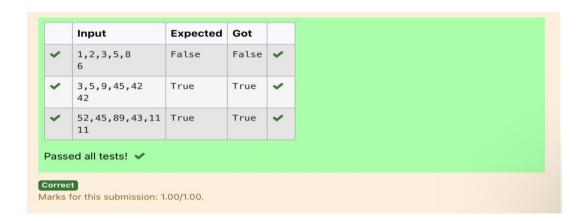

# Program:

a = input().split(",")

b = input()

print(b in a)

# Output:

Ex. No. : 10.5 Date: 5/6/24

Register No.: 231801155 Name: SARANYA V

.

## **Frequency of Elements**

To find the frequency of numbers in a list and display in sorted order.

#### **Constraints:**

1<=n, arr[i]<=100

#### Input:

1 68 79 4 90 68 1 4 5

### output:

1 2

4 2

5 1

68 2

79 1

90 1

### For example:

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

# Program:

def

count\_frequency(arr)

: frequency = {}

# Count the frequency of each number in the list for num in arr:

```
frequency[num] = frequency.get(num, 0) + 1

# Sort the dictionary based on keys
sorted_frequency =
sorted(frequency.items())

# Print the frequency of each
number for num, freq in
sorted_frequency:
    print(num, freq)

# Input the list of numbers
arr = list(map(int, input().split()))

# Count the frequency and print the result
count_frequency(arr)
```
